

Hydraulic Fittings

Hydraulic fittings are used in a variety of Industrial applications where a high pressure, no leak seal is a must. Hydraulic systems operate under immense amounts of pressure such that even the smallest loss in integrity, the slightest crack or the failure of the smallest seal, can result in major spillage of hydraulic fluid. Additionally, hydraulic power systems rely on system integrity a great deal. A leak in a hydraulic hose can cripple systems once capable of bulldozing brick buildings to the ground and lifting massive amounts of weight. The most common place for leaks to form in a hydraulic system is in the joints and fittings.

U.S. Hose & Coupling carries a wide variety of hydraulic fittings in common sizes, all the way to international threads.
